INF8245E - MACHINE LEARNING (FALL 2021) KAGGLE COMPETITION

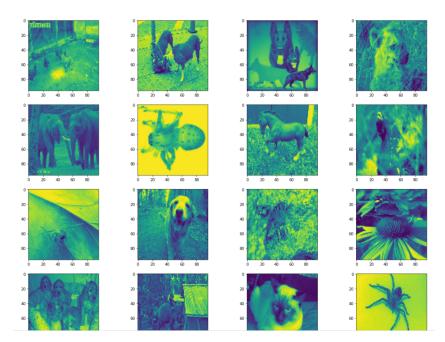

Deadlines

Team formation: November 8 at 10 PM EST Kaggle submission closing: December 8 at 10 PM EST Report submission: December 12 at 10PM EST

Background

For this project, you will take part in a Kaggle competition based on image analysis. The goal is to design a machine learning algorithm that can automatically identify animals. In this classification problem, we have 11 classes. The dataset consists of 11,887 images of size (96,96,1) for the training set and 17,831 for the test set. You will be evaluated on test F1-measure.

Examples of the training samples are shown below

First, you need to create an account on the Kaggle website, if you haven't already. Next, you can access the competition, including this dataset. We expect you to be working in groups of exactly 3.

Note: For this competition, you are not allowed to use any external data other than what is provided. However data-augmentation using only the given data is allowed. Also you are not supposed to use any pre-trained models, otherwise you will be disqualified from the competition.

1 Team Formation

To be able to form a team, follow these instructions below:

- Each team should consist of exactly 3 members;
- Fill out this google with your team information by Nov 8-th at 10PM, EST;
- Any team not registered or registered later will not be graded;
- Register as an individual Kaggle user, enter the competition and accept the terms and conditions.
- Go to Kaggle team
- In the Invite Others section, enter your teammates' names, or team name.
- Your teammate has the option to accept your merge. The person accepting a merge is the team leader.

Note on number of submissions: The maximum amount of submissions is 2 per day for the entire team. You should not make any submissions before the team formation deadline which is November 8-th EST. If you make any submissions before this, you might be disqualified from the competition. All the team members will receive same marks for this competition. It is your duty to make sure everyone has contributed to the competition equally.

2 Instructions

To participate in the competition, you must provide a list of predicted outputs for the instances on the Kaggle website. To solve the problem, we expect you to try the following methods:

- A baseline of SVM or logistic regression: using your own implementation or using a library.
- Any other ML method of your choice. Be creative! Some suggestions are neural network trained by back-propagation, k-NN, random forests, kernelized SVM, CNN's, etc.

For the Kaggle competition, you can submit results from your best performing system.

Note: We suggest you to start early, allowing yourself enough time to submit multiple times and get a sense of how well you are doing.

3 Report

In addition to your methods, you must write up a report that details the pre-processing, validation, algorithmic, and optimization techniques, as well as providing your Kaggle results that we compare them with. The report should contain the following sections and elements:

- Project title;
- Team name on Kaggle, as well as the list of team members, including full names, email and matricules.
- Feature design: Describe and justify your pre-processing methods, and how you designed and selected your features.
- Algorithms: Give an overview of the learning algorithms used without going into too much detail in the class notes (e.g. SVM derivation, etc.), unless you judged necessary.
- Methodology: Include any decisions about training/validation split, distribution choice for Naive Bayes, regularization strategy, any optimization tricks, setting hyper-parameters, etc.
- Results: Present a detailed analysis of your results, including graphs and tables as appropriate.
 This analysis should be broader than just the Kaggle result: include a short comparison of
 the most important hyper- parameters and all the methods you implemented.
- Discussion: Discuss the pros/cons of your approach methodology and suggest areas of future work.

- Statement of Contributions. Briefly describe the contributions of each team member towards each of the components of the project (e.g. defining the problem, developing the methodology, coding the solution, performing the data analysis, writing the report, etc.) At the end of the Statement of Contributions, add the following statement: "We hereby state that all the work presented in this report is that of the authors."
- References (optional).
- Appendix (optional). Here you can include additional results, more detail of the methods, etc.

The main text of the report should not exceed 6 pages. References and appendix can be in excess of the 6 pages. You should use the ICLR format. You can find the template in this link.

4 Submission Requirements

We are expect you to follow these rules:

- You must submit the code developed during the project. The code must be well documented.
 The code should include a README file containing instructions on how to run the code.
 Submit the code as an attachment (see Submission Instructions).
- Your submission should contain your Kaggle notebook named as "final.ipynb" which would reproduce your predictions exactly. Make sure to fix the random seeds so that the generated predictions are exactly matching your submitted prediction file.
- You must submit a written report according to the general layout described above.

5 Submission Instructions

For this project, you will submit the report to Gradescope, and the code to Moodle. Submit a zipped folder to Moodle. Your zip file should contain a folder called "code" that contains all code. Make sure we can directly run your notebook in Kaggle. We should be able to run your code without making any modifications. Your group report should be submitted to Gradescope. One submission per team is sufficient for both code and report.

6 Late Submission Policy

Late submission policy is the same as default policy used for the other assignments.

7 Evaluation Criteria

Marks will be attributed based on 50% for performance on the private test set in the competition and 50% for the written report. For the competition, the performance grade will be calculated as follows: The top team, according to the score on the private test set, will receive 100%. If the team doesn't cross the basic baseline, entered by the instructor, will score 0%. All other grades will be calculated according to the interpolation of the private test set scores between those two extremes. For the written report, the evaluation criteria include:

- Technical soundness of the methodology (pre-processing, feature selection, validation, algorithms, optimization).
- Technical correctness of the description of the algorithms (may be validated with the submitted code).
- Meaningful analysis of final and intermediate results.

- Clarity of descriptions, plots, figures, tables.
- Organization and writing. Please use a spell-checker and don't underestimate the power of a well- written report.

Do note that the grading of the report will emphasize the rationale behind the pre-processing and optimization techniques. The code should be clear enough to reflect the logic articulated in the report. We are looking for a combination of insight and clarity when grading the reports.

8 Questions and Clarifications

For additional questions, please use Piazza, or ask questions during the TAs office hours. For specific questions about the competition, you can use the office hours of Arjun and Valliappan.
